

Carb 3/4" 49"X97" Industrial 1M2 Particleboard Canadian

Description Particleboard is a non-structural interior product made from wood particles that are byproducts from the manufacture of other wood products. The wood particles are mixed with synthetic resins or binders and formed under heat and pressure into a panel. The dominant species of Canadian particleboard is Aspen. Particleboard can be sawed, shaped, and routed without chipping or flaking. Because it has an internal bond, smooth surfaces, and uniform density and strength, particleboard performs well as closet shelving or portable cabinetry. Note that particleboard may not be able to withstand stress as well as hardwood products, but its use in interior projects is economical and dependable.

BlueLinx supplier CARB (California Air Resource Board) certification requirements state that manufacturers of hardwood plywood, particleboard, and MDF using resins that contain formaldehyde be in compliance with the emission standards specified and must be verified by using a third-party CARB approved certifier.
